Event Management System Final Report

Project Overview

Events are where memories are made and moments celebrated. But organizing them? That's where things get a bit tangled. Want a solution ? : an easy-way-to-organize Event using our Event Management System Program in Java !

Imagine organizing your dream wedding, conference, or party without the stress and hassle. Our system takes care of all the details, from creating schedules to managing vendors. You can focus on enjoying the event while we handle the rest.

Objectives

Planning events can be a daunting task, but it doesn't have to be. Our Event Management System Program in Java is here to make your life easier!

With our Event Management System, you can:

- Create and manage events.
- Keep track of schedules and deadlines.
- Generate a list of all events.
- And much more!

Our event planning system is simple and straightforward. No more confusing spreadsheets or piles of paperwork. We've designed our system with you in mind, making it easy to manage your events without any hassle.

So why wait? Let our Event Management System Program in Java take the stress out of event planning. Contact us today to learn more !

Implementation Details

The system was developed using Java as the primary programming language within the Eclipse Integrated Development Environment (IDE). The code structure followed object-oriented principles, leveraging classes and methods to organize functionalities. The system employs

core Java concepts like inheritance, encapsulation, and polymorphism for efficient code management. Algorithms for event creation, management, and reporting were devised using modular programming approaches, ensuring scalability and maintainability. Additionally, the system integrates file handling techniques to store and retrieve event-related data, enhancing data persistence.

Source code

- **Event.java**

```
import java.io.Serializable;
@SuppressWarnings("serial")
public class Event implements Serializable {
    private String name;
    private String address;
    private String number;    // phone number
    private String timedate;
    public Event()
{
    name = "";
    address = "";
    number = "";
    timedate = "";
}
    public Event( String name, String address, String number, String timedate) {
        this.name = name;
        this.address = address;
        this.number = number;
```

```
        this.timedate = timedate;
    }
    public String getname(){
        return name;
    }
    public String getaddress() {
        return address;
    }
    public String getnumber(){
        return number;
    }
    public String gettimedate(){
        return timedate;
    }
}
```

- **EventManagementSystem.java**

```
import java.io.*;
import java.util.*;
public class EventManagementSystem {
    public static void menu() {
        // Creating a menu for chose a options from user/keyboard.........
        System.out.println("What you want to do my buddy");
        System.out.println("1. Add Event's Details\n");
        System.out.println("2. Show event's Details");
        System.out.println("3. Edit the event ");
        System.out.println("4. Delete any event ");
        System.out.println("5. You wanna exit the system ?");
    }
```

```
    /**
     * @param args
     * @throws Exception
     */
    @SuppressWarnings({ "unchecked", "resource" })
          public static void main(String args[]) throws Exception {
        Scanner in=new Scanner(System.in); //to take a  integer value form user or keyboard (in
is for interger)
        Scanner sc = new Scanner(System.in); // to take Sting value from user or keyboard (Sc
for string)
//        creating array list
        ArrayList <Event> arr = new ArrayList<Event>();
//        Event*list text file is made and data is stored there
        File file = new File("Eventlist.txt");
        ObjectOutputStream wData = null;  //For wrote a data in file
        ObjectInputStream rData = null;
        if (file.isFile())
        {
          rData = new ObjectInputStream (new  FileInputStream(file));
          arr = (ArrayList<Event>)rData.readObject();
          rData.close();
        }
        int choose = -1;
        do{
            menu();
            System.out.println("How do you want to manage your event sir/maam ?");
            choose = in.nextInt();
            switch(choose)
            {
                case 1:
```

```
            System.out.println("Enter event title ");
            String name=sc.nextLine();  //to get the input as string
            System.out.println("Enter the address the event gonna happen:");
            String address = sc.nextLine() ;
            System.out.println("Enter event orgranizer phone number ");
            String number = sc.nextLine();
            System.out.println("Enter Event time and date:");
            String timedate = sc.nextLine();
            //call array
            arr.add(new Event( name, address, number, timedate)); //using Construction
method;
            wData= new ObjectOutputStream( new FileOutputStream(file));
            wData.writeObject(arr);
            wData.close();
            System.out.println("Your event have been added to our system");
            break;
        case 2:
        {
             ListIterator<Event> il = arr.listIterator();
             while(il.hasNext()) {
                     Event eve = il.next();
                     System.out.println("The event name : " + eve.getname() +"\n" + "The
event address : " + eve.getaddress() +"\n" + "The date of the event : "  + eve.gettimedate() +
"\n" + "Number of event orgranizer : "+ eve.getnumber() +"\n" + "\n" +"Another event is :" +
"\n");
             }
        }
        System.out.println("These all are your events.");
             break;
        case 3:
            // Code for editing an event
```

```
System.out.println("Enter the event title you want to edit:");
String editTitle = sc.nextLine();
// Find the event with the given title
boolean eventFound = false;
for (int i = 0; i < arr.size(); i++) {
    Event event = arr.get(i);
    if (event.getname().equalsIgnoreCase(editTitle)) {
        System.out.println("Enter new event title:");
        String newName = sc.nextLine();
        System.out.println("Enter new address:");
        String newAddress = sc.nextLine();
        System.out.println("Enter new organizer phone number:");
        String newNumber = sc.nextLine();
        System.out.println("Enter new event time and date:");
        String newTimeDate = sc.nextLine();

        // Update the event details by creating a new Event object
        Event updatedEvent = new Event(newName, newAddress, newNumber,
newTimeDate);
        arr.set(i, updatedEvent);
        wData = new ObjectOutputStream(new FileOutputStream(file));
        wData.writeObject(arr);
        wData.close();
        System.out.println("Event updated successfully.");
        eventFound = true;
        break;
    }
}

if (!eventFound) {
```

```
            System.out.println("Event not found.");
        }
        break;
    case 4:
        // Code for deleting an event
        System.out.println("Enter the event title you want to delete:");
        String deleteTitle = sc.nextLine();

        // Create an iterator to safely remove elements
        Iterator<Event> iterator = arr.iterator();
        boolean eventDeleted = false;
        while (iterator.hasNext()) {
            Event event = iterator.next();
            if (event.getname().equalsIgnoreCase(deleteTitle)) {
                iterator.remove(); // Safely remove the event
                eventDeleted = true;
                break; // Exit the loop after the event is deleted
            }
        }
        // Write the updated list of events (with the deleted event removed) back to the file
        wData = new ObjectOutputStream(new FileOutputStream(file));
        wData.writeObject(arr);
        wData.close();
        if (eventDeleted) {
            System.out.println("Event deleted successfully.");
        } else {
            System.out.println("Event not found.");
        }
        break;
```

```
            case 5:
                System.exit(0);
        }
    } while (choose != 0);
  }
}
```

User Manual

User manual is a guide which shows how this program works in real world. The only things you need to do is press the number for adding, editing, deleting, viewing the events and also for exiting the system.

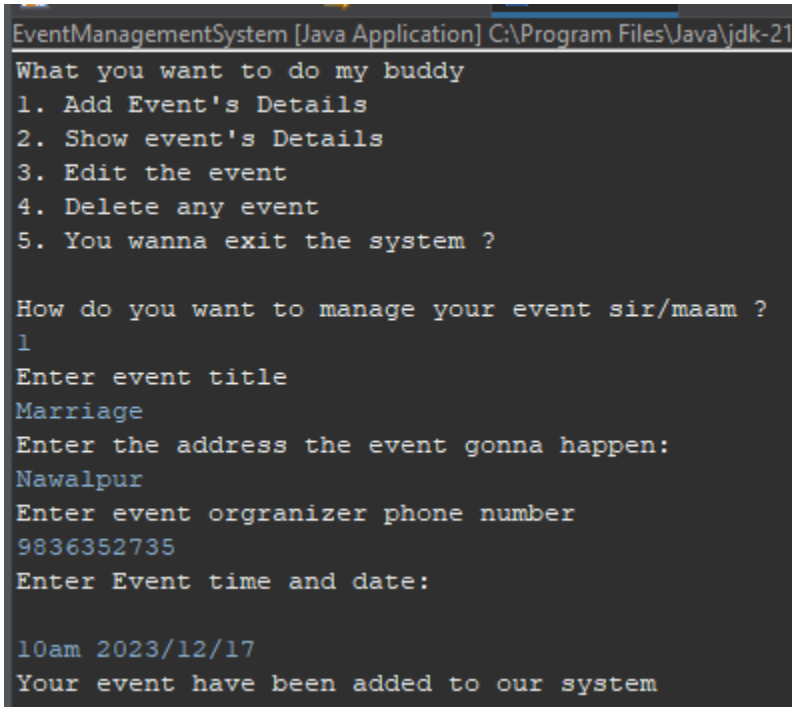
It is requested for all users and any new comer to read this guide carefully. If any problem occurs you can email us in : eventmanagement@gmail.com or call us at : +977-9836353638. We provide 24/7 live support.

Also, if the user tries to use the system without using the manual if something bad occurs, we won't be responsible for any error.

To install, users need to download the program and import it into Eclipse. Detailed step-by-step instructions are provided for setting up the development environment.

1. **Event Registration:**
   Seamlessly register for events by providing basic info like name, address, contact detail and date-time.

   - After opening the program "Press 1" to register any event.
   - Then enter the details as shown in figure.
   - You can add multiple events one by one just need to press 1.



```
What you want to do my buddy
1. Add Event's Details
2. Show event's Details
3. Edit the event
4. Delete any event
5. You wanna exit the system ?

How do you want to manage your event sir/maam ?
2
The event name : Marriage
The event address : Nawalpur
The date of the event : 10am 2023/12/17
Number of event orgranizer : 9836352735

Another event is :

The event name : Party
The event address : Nagman party palace, Ratnapark
The date of the event : Sunday 12pm, 2023/9/12
Number of event orgranizer : 9836363738
```

2. **Listing Events:**

Want to see all the registered events at once serially. No worries, we will tell you how :

- Press 2.
- All the events are listed at 1 click as shown in figure.

3. **Edit the events :**

While registering the events sometime we may make some mistakes, it maybe typing mistake or sometime we need to change number or address the we can easily edit the details.

- This is the old event when I register some time ago.

```
The event name : Party
The event address : Nagman party palace, Ratnapark
The date of the event : Sunday 12pm, 2023/9/12
Number of event orgranizer : 9836363738
```

- To edit this, “Press 3”.
- Enter the title of the event when you want to edit.
- If you don’t remember the title, you can pick by pressing number 2 which will provide a list of all events.
- After entering the title, edit all the components as required :

```
How do you want to manage your event sir/maam ?
3
Enter the event title you want to edit:
Party
Enter new event title:
Big Party
Enter new address:
Ramni party palace, Bhaktapur
Enter new organizer phone number:
 9836363738
Enter new event time and date:
Sunday 12pm, 2023/9/12
Event updated successfully.
```

- Like this you can edit the events.

4. **Delete any event :**

Like the edit part, deleting any event is also very easy. You can delete any event just by pressing the number and it’s title. But remember one thing, once the event is deleted it will be gone for forever. You can also delete the event when it is done or cancelled .

- “ Press 4 ” .
- Enter the title of the event which you want to delete.

```
How do you want to manage your event sir/maam ?
4
Enter the event title you want to delete:
Big party
Event deleted successfully.
```

To check the whether the event is deleted or not :

- Press 2 to list the events.
- Boom, its done.

```
How do you want to manage your event sir/maam ?
2
The event name : Marriage
The event address : Nawalpur
The date of the event : 10am 2023/12/17
Number of event orgranizer : 9836352735

Another event is :

These all are your events.
What you want to do my buddy
1. Add Event's Details
2. Show event's Details
3. Edit the event
4. Delete any event
5. You wanna exit the system ?
```

5. **Exiting the system :**

After completing all the tasks, to exit the system :

- Just press 5.
- Then enter, You are out of system.

```
How do you want to manage your event sir/maam ?
5
```

In conclusion, this user manual serves as a reliable companion, offering clear and comprehensive instructions for users to seamlessly navigate and utilize the system's features. With its user-friendly layout and detailed guidance, this manual aims to empower users, ensuring a smooth and efficient experience while interacting with the system

Testing and Validation

We tested the system to make sure it works correctly and does what it's supposed to do. First, we checked each part of the system by itself (like making sure creating an event works right). Then, we tested how those parts work together (like checking if registering for an event after creating it goes smoothly). We tried different things to see if the system would still work okay, like putting in weird information or doing things in the wrong order. Everything we tested turned out okay, and the system did what we expected it to do.

Results and Performance

When we used the system, it worked pretty well. It did things quickly, like creating events and managing them without taking too long. The system gave the right answers and didn't make mistakes. We didn't check everything super closely, but from what we saw, it seemed to work just fine. Users didn't have to wait for a long time, and it didn't use up too much computer memory. Overall, it seemed to do what it was supposed to do without any big problems.

Troubleshooting

i. Setting up CLI and Importing Code:

- Follow the steps in the provided guide in java ide and jdk website for setting up the command line and importing the code.
- Make sure you have the necessary software installed and updated for running CLI programs.
- If you encounter issues, look for online guides specific to your CLI environment for troubleshooting help.

ii. File Saving Problems:

- After entering details, ensure you've correctly saved the information using the provided commands.

- Check if there's enough space available in the directory you're saving to.
- If details aren't saving, try saving to a different folder or restart the CLI program and attempt saving again.

Conclusion

So, to sum it all up: this project's about making event management easy. We proposed, built, and tested a simple Java-based system for managing events. We dug into the technical stuff, made sure it works right through testing, and then created a user guide that's spot-on for helping folks use the system hassle-free. It's all aimed at making event planning a breeze for anyone who wants a reliable tool to handle it smoothly.
